New Study Shows Vaping Consistently Kills at A Far Slower Rate Than Conventional Cigarettes

LOS ANGELES--- A new study conducted by a middle school in California has found that JUUL is proven to kill people at a slower rate than conventional cigarettes. The groundbreaking researchers, two eighth graders by the names of Dominic and Richie, who found that their e-cigarettes are far less effective than regular cigarettes at killing people. The study collects the health data of everyone that both Dominic and Richie

know that smoke, as well as vape. After collecting data from as many family and friends as possible, both Dominic and Richie have concluded that “smoking kills wayyyy more often”. “I always see grandma smoking cigarettes, and to be honest I don’t see her living much longer” said Richie. He compared this to the health of his friends who are avid vapers, stating “Usually the worst I see from them is just a cough that seems to bother them”.

Policymakers are overjoyed by this research, making promises to legislate accordingly. Kamala Harris(D) made it extremely clear that it’s important America addresses the problems found in killing too many people by smoking cigarettes. “We have deprived our children of the joy of nicotine for far too long, so it’s wonderful that we can finally have them die much more slowly while still enjoying that rush. It serves to make this

country much more united.” Unfortunately, this was the only statement our reporters could receive from her as she was late for a fundraising event.

However, detractors have expressed concern over de-regulation due to e-cigarettes serving as far less effective population control. Republican Mitch McConnell brought up the ever-growing number of children on his lawn, showing the importance of having cigarettes dominate the smoking industry. “E-cigarettes just aren’t good enough to

control the masses. We need to de-regulate conventional cigarettes to end all of the raucous laughter and joy in a much more effective manner.”

Public opinion of e-cigarettes has shot through the roof however, many parents are eager to share the rush with their children. Karen, Richie’s mother, is proud of her son in conducting this study and hopes he can fend off dying for a few years longer than his grandmother. “In this insignificant world where we’ll all die with beautiful indifference, it’s great that my son can enjoy the rush of nicotine for a few years longer than his predecessors.”

There has been some push back from fringe groups, however. Some older people from Richie’s local college, UCLA made outlandish claims that e-cigarettes are devastating to the development of a child or young adult. They seemed to believe that children are somehow more susceptible to addiction to e-cigarettes, even though all of Richie’s friends swear they aren’t addicted. To these groups Richie and Dominic had a very simple rebuttal: “Ok boomer”.
